

MACHINE LEARNING

1. Which of the following methods do we use to find the best fit line for data in Linear Regression?
A) Least Square Error
2. Which of the following statement is true about outliers in linear regression?
A) Linear regression is sensitive to outliers
3. A line falls from left to right if a slope is _____?
B) Negative
4. Which of the following will have symmetric relation between dependent variable and independent variable?
A) Regression
5. Which of the following is the reason for over fitting condition?
C) Low bias and high variance
6. If output involves label then that model is called as:
B) Predictive model
7. Lasso and Ridge regression techniques belong to _____?
D) Regularization
8. To overcome with imbalance dataset which technique can be used?
D) SMOTE
9. The AUC Receiver Operator Characteristic (AUCROC) curve is an evaluation metric for binary classification problems. It uses _____ to make graph?
A) TPR and FPR
10. In AUC Receiver Operator Characteristic (AUCROC) curve for the better model area under the curve should be less.
A) True
11. Pick the feature extraction from below:
B) Apply PCA to project high dimensional data
12. Which of the following is true about Normal Equation used to compute the coefficient of the Linear Regression?
A) We don't have to choose the learning rate.
B) It becomes slow when number of features is very large.
C) We need to iterate.
13. Explain the term regularization?
Regularization is a technique used to reduce the error by fitting a function appropriately on the given training set and avoid overfitting.
14. Which particular algorithms are used for regularization?
Ridge and Lasso regressions.
15. Explain the term error present in linear regression equation?
Error is the difference between the actual and predicted values. Linear regression model aim is to best fit the linear line and values of intercept and coefficients such that error is minimized.
